

V. SOLAR RADIO EMISSION

EXPLANATION

Observing Stations

1. Code names are consistent with those in Solar Geophysical Data (S.G.D.), NOAA, Boulder, U.S.A.
2. Std. CMP shows approximate UT of the local noon. Two figures after each of Std. CMP may be used for estimating approximate observation time. For example, 1200,7,3 means that observations will be possible during the period between 1200-0700 and 1200+0700, and 1200-0300 and 1200+0300 near solstices in June and December respectively.

Daily and Monthly Means of Flux Density

1. Daily mean values are approximated by integers. Monthly mean values are approximated to tenths in the cases when the observations are complete, when the mean value is less than 10 solar flux units, or when number of days with no observation is only one for frequencies less than 1000 MHz. Mean values are not entered when number of days with no observation is greater than or equal to 4.

$$1 \text{ solar flux unit (s.f.u.)} = 10^{-22} \text{ W m}^{-2} \text{ Hz}^{-1}.$$

2. Correction factors which are shown for frequencies greater than or equal to 500 MHz are derived from smooth spectrum connecting monthly means of absolutely calibrated values. They are marked with underlines when these values are consistent with those reported in the Final Report of the Working Group on the absolute solar radio flux calibration presented to the URSI General Assembly, Warsaw 1972 (cf. Solar Physics, 29, 243-262, 1973). The values of correction factor without underlines are regarded as provisional ones which are applicable only to the present 3 months.

WDC-C2 for Solar Radio Emission
Nobeyama
K. Shibasaki

| Observing Station | CODE | Lat. | Long. | Std. CMP | Frequencies (MHz) |
